World premiere at DSEI 2019

10 September 2019

Two in one – Rheinmetall's new 60mm mortar for infantry and special forces

At DSEI 2019 in London, the international defence community will get its first-ever look at Rheinmetall's new 60mm mortar for infantry and special operators. The RSG60 features innovative design and engineering characteristics which make this indirect fire system very light and easy to handle. A few quick manual adjustments turn the 15.8 kg standard infantry version into a commando mortar weighing just 6.8 kg, with no need for tools. This makes the RSG60 a two-in-one solution. In addition, Rheinmetall has developed an ergonomic new quick-release carrier system for the RSG60, meaning that the weapon is ready for action or transport in a matter of seconds. Together with the carrier system, the infantry version of the RSG60 weighs just 23 kilos.

Depending on the ammunition and charges, the standard version can attain ranges of up to 3,200 metres. Equipped with a thirty centimetre-longer barrel, the range increases by around 500 metres. The commando variant of the RSG60 has a range of around 2,000 metres.

About 70 centimetres long, the barrel is made of steel with a carbon fibre over-wrap. This assures the necessary stability at the same time as lower weight, resulting in a barrel that weighs around 30 percent less than a conventional steel mortar. The base plate is made of carbon fibre composite material. The novel design of this indirect fire weapon not only saves space, it can be set up and ready to fire in a matter of seconds. Furthermore, by loosening the retaining bolts, it is possible to separate the RSG60 from the base plate in around thirty seconds, transforming it into a lighter-weight commando mortar.

Development of the new mortar began in October 2017 at Rheinmetall Waffe Munition. Rheinmetall's objective was to augment the Group’s versatile family of 60mm ammunition and existing Rheinmetall Electronics fire control technology with a matching, future-oriented weapon system. Right from the start, development work therefore focused on low weight, speed and ergonomics.

The RSG60 has repeatedly undergone successful test firing.
